Availability: Jan–Dec 2027 for internships in the San Francisco Bay Area

Singapore citizen; eligible for 12-month J-1 visa sponsored by NUS; program hosted by Stanford University.

AI Engineer & Founder specializing in high-performance agentic systems (MCP). Reduced delivery timelines from weeks to days (Tweakler) and documentation overhead by 78% (AssessMate).

Education

National University of Singapore 2025 – 2029

B.Comp. (Hons) in Computer Science • **Teaching Assistant, CS1101S Programming Methodology**

AIE Scholarship – Selected as 1 of 20 recipients

Technical Skills

Languages/Runtime: Python, Zig, C++, Rust, TypeScript/JavaScript, Node.js
AI & Data: MCP (stdio/HTTP), PyTorch, Transformers, OpenAI API, pgvector, FastAPI, Pydantic
Systems & Infrastructure: Linux, Docker, GitHub Actions CI/CD, Fly.io, PostgreSQL, pytest, Playwright

Experience

Co-Founder & CCSGP Fellow (AssessMate) 2026 – Present

- Reduced case-note documentation time from 90 to 20 minutes per child (a 78% reduction) by building AssessMate, an AI copilot that processes PDPA-sensitive data for early childhood intervention assessors.

AI Engineer Intern, Mission Systems Sep 2026 – Present

- Built a Brandwatch alternative for content ideation, multi-account scheduling and performance insights; estimated to save 400 marketing hours/year.
- Built an in-house n8n replacement with sandboxed JavaScript; load tests sustained 50 webhook requests/s at 32 ms p95 ingress latency.
- Built meeting intelligence to transcribe, extract action items and create a searchable company knowledge vault; saving around 10 staff-hours/week.

Founder, Tweakler 2026 – Present

- Founded Tweakler, a reference-led site generator: transforms one-line briefs into editable, brand-specific sites by deriving audience values and surfacing diverse design references.
- Reduced website delivery timelines from 3 - 4 weeks to under 7 days for studios like Brightsea Studio by building a reference-led generation system with an MCP workflow.

Research Assistant, National University of Singapore Jan 2026 – Jun 2026

- Systematized the lab's evaluation of 3DGS methods by building a dynamic benchmark with 11 YAML pipelines and a 6-metric evaluator, enabling consistent performance tracking across 6 method repositories.

Projects

EvoServe - Automated Benchmark Construction 2026 – Present

- Designing automated benchmark sourcing and task generation with quality-diversity search, grounded reference answers and task-specific success metrics.
- Built a deterministic offline verifier in Zig for captured-run evidence and auditable quality and regression reports; defined benchmark admission criteria with adversarial grader checks and held-out evaluation.

Local Small LM from Scratch 2024

- Built a custom GPT-2 124M variant from scratch in PyTorch on local hardware (tokenizer, transformer blocks, optimizer, mixed-precision training, and FineWeb-Edu evaluation); trained on 10B tokens.

WikiBase – Source-Grounded Knowledge Platform 2026

- Built WikiBase to turn PDFs and notes into cited wikis, Q&A and flashcards; designed its FastAPI/PostgreSQL/pgvector backend, idempotent 5-stage pipeline and Docker/Fly.io deployment with CI/CD.

Competitions

Replit Agent Hackathon 2026

- 1st place: Built Remember, an AR memory assistant combining face recognition, speech transcription, LLM memory extraction and voice Q&A over a persistent personal knowledge graph.

Google DeepMind × Cactus (YC S25) Global Hackathon 2026

- 2nd place: Built SecureClaw, a privacy router for 12 PII types with 3 routing modes, on-device/cloud inference, and a 30-case benchmark.
